What Is Security?

Computer Security

The protection afforded to an automated information system in order to attain the applicable objectives of preserving the integrity, availability, and confidentiality of information system resources.

NIST Computer Security Handbook

Network and Internet Security

Measures to deter, prevent, detect, and correct security violations that involve transmission of information.

Stallings, Cryptography and Network Security

Key Security Concepts

Others: Authenticity, Accountability

Impact of Security Breaches

How do security breaches impact organisations?

- ▶ Effectiveness of primary operations are reduced
- ▶ Financial loss
- ▶ Damage to assets
- ▶ Harm to individuals

Different levels of impact. E.g. FIPS Publication 199 defines: Low/Minor, Moderate/Significant, High/Severe

ITU-T X.800 Security Architecture for OSI

- ▶ Systematic approach to define requirements for security and approaches to satisfying those requirements
- ▶ ITU-T Recommendation X.800, *Security Architecture for OSI*
- ▶ Provides abstract view of main issues of security
- ▶ Security aspects: Attacks, mechanisms and services
- ▶ Terminology:
 - ▶ Threat: potential violation of security
 - ▶ Attack: assault on system security derived from intelligent threat

Aspects of Security

Security Attack

Any action that attempts to compromise the security of information or facilities

- ▶ Threat: potential for violation of security of information or facilities

Security Mechanism

A method for preventing, detecting or recovering from an attack

Security Service

Uses security mechanisms to enhance the security of information or facilities in order to stop attacks

A Model of Network Security

Types of Attacks

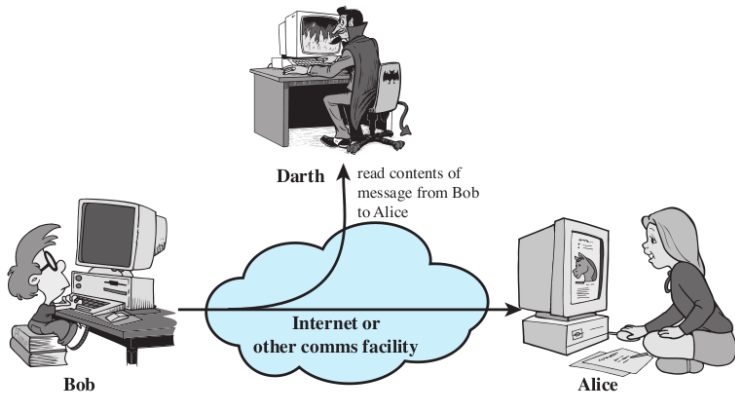

Passive Attack

- ▶ Make use of information, but not affect system resources, e.g.
 1. Release message contents
 2. Traffic analysis
- ▶ Relatively hard to detect, but easier to prevent

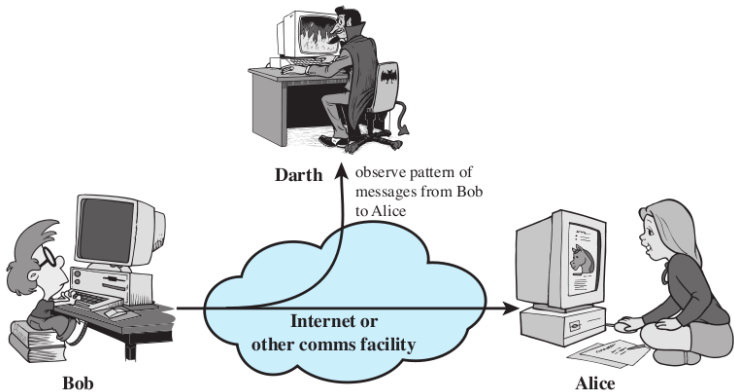

Active Attack

- ▶ Alter system resources or operation, e.g.
 1. Masquerade
 2. Replay
 3. Modification
 4. Denial of service
- ▶ Relatively hard to prevent, but easier to detect

Security Mechanisms

A Model of Network Security

Defining a Security Service

- ▶ ITU-T X.800: *service that is provided by a protocol layer of communicating systems and that ensures adequate security of the systems or of data transfers*
- ▶ IETF RFC 2828: *a processing or communication service that is provided by a system to give a specific kind of protection to system resources*
- ▶ Security services implement security policies and are implemented by security mechanisms

Security Services

1. **Authentication** Assure that the communicating entity is the one that it claims to be. (Peer entity and data origin authentication)
2. **Access Control** Prevent unauthorised use of a resource
3. **Data Confidentiality** Protect data from unauthorised disclosure
4. **Data Integrity** Assure data received are exactly as sent by authorised entity
5. **Nonrepudiation** Protect against denial of one entity involved in communications of having participated in communications
6. **Availability** System is accessible and usable on demand by authorised users according to intended goal

Security Services

Security Mechanisms

A Model of Network Security

Security Mechanisms

- ▶ Techniques designed to prevent, detect or recover from attacks
- ▶ No single mechanism can provide all services
- ▶ Common in most mechanisms: **cryptographic techniques**
- ▶ Specific security mechanisms from ITU-T X.800:
Encipherment, digital signature, access control, data integrity, authentication exchange, traffic padding, routing control, notarization
- ▶ Pervasive security mechanisms from ITU-T X.800:
Trusted functionality, security label, event detection, security audit trail, security recovery

Security Services and Mechanisms

Concepts

Architecture

Attacks

Services

Mechanisms

Model

Service	Mechanism							
	Enciph- erment	Digital signature	Access control	Data integrity	Authenti- cation exchange	Traffic padding	Routing control	Notari- zation
Peer entity authentication	Y	Y			Y			
Data origin authentication	Y	Y						
Access control			Y					
Confidentiality	Y						Y	
Traffic flow confidentiality	Y					Y	Y	
Data integrity	Y	Y		Y				
Nonrepudiation		Y		Y				Y
Availability				Y	Y
